README

- The GML schema files are in XSD (XML Schema Definition) format.
- A GML schema for S-100 is used to define the structure and data type of a GML dataset and describe what is valid content for the file.
- On the command line, you can validate a GML schema by:
  ```
  > xmllint --noout test_gml_schema.xsd
  > echo $?
  ```
    - If a "0" is returned, there are no basic parsing errors in file
    - If a "1" is returned, there may be a parsing error in the file
    - There may be some lines returned indicating where there is an error.
    - A common error can be a missing ">" or "<" in a previous line of the error line is being printed.
